

# Integrated!

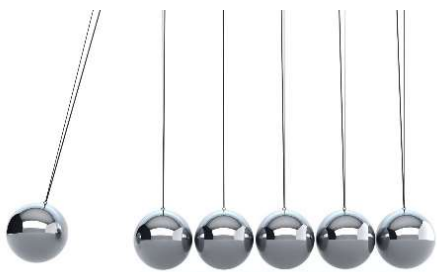

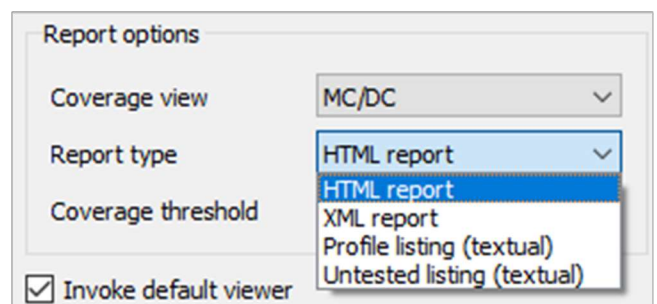

## Testwell CTC++ in IAR Embedded Workbench

Testing of safety critical software requires evidence of code coverage. For users of IAR Embedded Workbench, this task gets easy with Testwell CTC++ integration – direct from the IDE and seamless with IarBuild.

## IDE Integration

The integration of Testwell CTC++ manages the full workflow with dialogues from the IDE:

1. **Choice of Testwell CTC++ options**
2. **Instrumented Builds**
3. (Testing as usual)
4. **Generation of Coverage Reports**

## Build Server

Testwell CTC++ integrates with the existing IarBuild process – there is no need for an additional configuration when `ctclaunch` is used. Automated builds independent from the IDE are fully supported. On build servers, instrumented and normal builds work in parallel without interference.
